INTRODUCTION

1850, 1860, 1870 and 1880, census enumerators were directed to secure, in addition to the usual required census data, information as to all persons living within the twelve months preceding the taking of the census. These lists, which were filed in Washington, became known as the "Mortality Schedules".

These schedules contain valuable information for genealogists and historians, as they antedate the establishment of vital records in the majority of the states, certainly in Arkansas. They report 13 percent of all deaths during a 31-year period, and that 31-year period is just when those born in the 1790-1820 decades were completing the normal lifespan.

The ABC's of American Genealogical Research" by E. Kay Kirkham, published in 1955, states that a number of years ago, when the mortality schedules had served their purpose and the matter of their destruction as useless papers arose, the Daughters of the American Revolution requested them. After consideration by the appropriate committees of Congress, the Director of the Census was authorized to return each schedule to the state concerned by presentation to the State Library, Archives, or similar department, or to a recognized historical society of the state, at the request of such state agency or historical society, or in the absence of such request, to give them to the Daughters of the American Revolution in Washington.

At that time the schedules for Arkansas were requested and were given to Hendrix College, at Conway, Arkansas.

In 1966, the compilers contacted officials at Hendrix College in an attempt to obtain copies of these "mortality schedules" only to learn that the originals had been given by the Hendrix College Library in 1955 to the University of Arkansas at Fayetteville, where they have been bound in approximately 25 volumes. These reports were microfilmed prior to being sent to Fayetteville by the Office of the Secretary of State, in Little Rock, Arkansas, who has the negative microfilm. There is a positive copy of this film on file at the Arkansas History Commission in Little Rock, and to our knowledge, these are the only available copies of the mortality schedules for Arkansas.

The following information was taken from the 1850 "Mortality Schedule" for Arkansas. It was reported by the families as they were enumerated during the taking of the census and is designated as "All deaths occurring in the family within the past 12 months."

In this alphabetized record, the surname of the individual is listed first. All persons are white unless otherwise indicated by an (S) following the name, indicating slave or (Mu) indicating mulatto slave. Because of limited historical and genealogical value, slaves were omitted from this report when only the given name was listed, with no identifying information.

The age of the deceased is given in years, unless an infant of less than one year, which is given in months; or less than one month, in days.

In this report, the usual abbreviation of "f" has been used for female and "m" for male.

An "M" or "W" in the 4th column indicates the individual was married or widowed.

Place of birth. In most instances, only the state of birth is given. In the few instances where the county was listed, this information has been included.

The month in which the death occurred.

Cause of Death: The disease and cause of death have been recorded as nearly as possible as they were written in the original schedule. No effort has been made to correct spelling or to define any of the diseases.

The length of time the individual was ill is generally given in days or as "chronic", "sudden", etc.

County: The county in which the death was reported. This will not necessarily mean the county in which the death occurred, but the county in which the family lived at the time they were enumerated in the census. In order to conserve space in this column, county names are abbreviated as follows:

Crittenden (Critten.)	Larayette (Laf'ette)
Hempstead (Hempstd.)	Mississippi (Miss.)
Hot Spring (Hot Spg.)	Montgomery (Montgmy)
Independence (Indep.)	St. Francis (St. Fran.)
Jefferson (Jeff.)	Van Buren (Van. Bur.)
Washington (Wash.)	

Remarks: In some instances, the assistant marshal of various counties listed no added remarks. Those that did, gave topographical data for the county, type of soil, water, timber, prevailing diseases and any unusual characteristics of the county. Remarks concerning counties follow the alphabetical listing of the Mortality Schedules.

Arkansas Township:

Asher H. Stillwell, Asst. Marshall
Disease, most prevalent - chill and fever owing to the wet low lands. Pneumonia in winter - fever is also common in this subdivision - cause - the same as that which produces chill and fever. Water - but few springs and these impregnated with some mineral substance, probably iron. Soil - highlands generally sterile, bottoms fertile. Timber, oak, hickory, gum, dogwood, ash and cottonwood.

Villemont Township:

Pneumonia, or winter fever, is the disease most prevalent in this section - cause, the ponds and cypress swamps in the township from which arise noxious vapors. Water. There are no springs. Wells afford good water having no known mineral properties. Soil, generally thin and sterile, with a substratum of red and yellow clay. Timber, oak, hickory, gum, dogwood, ash and cottonwood.

Doughlass Township:

Disease most common, chill and fever - Cause - stagnant water from the overflowing of the river Arkansas. There are no springs. Well water generally good and free from mineral properties. No rock, no ores, no natural fertilizers. Soil - on the upland thin - in the river bottoms rich alluvian on a layer of sand. Timber - oak, hickory, gum, dogwood, ash, elm and cottonwood.

Old River Township:

In this subdivision are numerous lakes, swamps and marshes, and the malaria arising from them causes chills and fever, though not many cases prove fatal. There are no springs. Wells afford pure water. Soil - rich alluvian on a substratum of sand and red clay. Timber - ash, oak, cottonwood, elm, box elder, gum and cypress.

Prairie Township:

Disease most prevalent, chill and fever. Cause - lowness and wetness of the lands. There are also some cases of pneumonia caused usually by exposure to the weather. There are no springs. Well water impregnated with sulphur. Soil - a rich mould on a substratum of clay. No fertilizers, no rock, marl, or ores yet discovered. Timber - oak, hickory, walnut, gum, elm. Undergrowth sumach and tear blanket.

Crockett Township:

Chill and fever is the disease most prevalent in this subdivision, no known local cause. The inhabitants are principally newcomers and not yet acclimated. Soil - generally thin, dry and gently undulating lands. Water - no springs. No rocks, marl or ores known of. Timber - oak, hickory, elm, dogwood, some lynn.

Polk Township:

Chill and fever is the disease most prevalent in this township - no known local cause. The inhabitants are principally new settlers and not yet acclimated. There are no springs and but few wells, which afford water impregnated with some kind of mineral, probably sulphur. Timber - oak, hickory, gum, dogwood & lynn.

ASHLEY COUNTY

No remarks

BENTON COUNTY

There is no prevailing malady in this county. Neither is there any local cause of any. Our county is high elevated - no stagnated water, but abounds with numerous never-failing springs of pure and never-failing water, both free and limestone. The growth of the uplands is, hickory, postoke, black jack, and black oak; undergrowth horel and chewmake. The bottom land timber - cherry, black oak, walnut, black locust. Rock. the northwestern part of the county limestone gray and blue, the east part is a yellow sand rock. A. Whinery, Asst. Marshall

BRADLEY COUNTY

No remarks

CARROLL COUNTY

L. Denton, Asst. Marshall
Freestone water; soil, second rate; smallpox, a few cases confined to a few families. Unusual number of sudden deaths during the year.

CHICOT COUNTY

No remarks

CONWAY COUNTY

No remarks

CLARK COUNTY

No remarks

CRAWFORD COUNTY

F. S. Clark, Assistant Marshall

Mountain Township:

This township together with Lees Creek Township is situated in most elevated portions of Arkansas and its entire population is confined by high mountains to the head branches of Frog Bayou, a stream which issues by several heads from Boston Mountains and runs southward to the river. The soil along the stream is remarkably fertile, except the township is composed of entire mountains and uninhabited. The water is as pure cold and clear as could well be imagined. Van Buren is the county seat situated on the north side of the river. It is a healthy town though not the healthiest part of the county. The principal diseases are chills remittent and intermitten fevers.

Sugar Loaf Township: This is the largest township in the county situated in the southern extremity between the Potau and Sugar Loaf Mountains. It is composed of oak barrens and prairie generally level possessing various kinds of soil mostly fertile producing a luxuriant vegetation. Water - very good but not the best in the county. Health very good; prevailing diseases chills and fevers.

Lafayette Township: A portion of this township is the most elevated land in Arkansas. The population of the township is confined by high mountains to Lee's Creek and it's various

branches which stream issues out of the Boston Mountains and empties into the river. The soil along the streams which alone can be cultivated is remarkably fertile. This township is as healthy as could well be imagined. The water is pure cold and clear. The climate salubrious and very exelering.

- Upper Township: This township is composed of prairie and Barron mostly level, not very fertile except the river bottoms. Water good, is healthy and no particularly prevailing diseases.
- The City of Fort Smith: The city of Fort Smith is situated upon a high bluff at the junction of the Potau with the Arkansas River and immediately on the Indian line. The site is high and beautiful. It is one of the most healthy places and the river is on the west and is situated upon the great road that leads from St. Louis to Texas. The water is remarkably good and the climate delightful. Bilious fever is perhaps the most prevalent disease.
- Jasper Township: This township is composed of oak barrens, is mostly level. The soil a mixture of sand and gravel of a light red color. Geological formations - the new red sandstone. The health is remarkably good. Diseases - chill remittent and intermittent fevers.
- Van Buren Township: This township surrounds the city of Van Buren - is a level extent of oak barrens, well watered, not remarkably fertile and generally healthy. A portion of it is composed of river bottoms where chills and fevers prevail. The most notable geological feature is the prevalence of the new red sandstone formation which gives a yellow or red appearance to the soil.

CRITTENDEN COUNTY

No remarks

DALLAS COUNTY

Rich'd L. Duff, Assistant Marshall

The water of the uplands is free stone found in abundance leaking out in fine springs and easily obtained by wells whilst the county is covered by innumerable streams - the water of the river lands is not so fine. The rock is sand stone. The soil of the upland is composed of clay and vegetable mould. That on the Ouachita and Saline, Moro and Tulip streams - alluvial. The timber is principally pine and different varieties of the oak interspersed with the hickory, gum, dogwood, holly, etc. No natural fertilizers. Seasons extremely wet or dry - of the phenomena may be mentioned several land slides upon the hillsides where the soil for several acres has sunken below its natural position from 30 to 50 feet. The county is too recently settled to be able to record any interesting events or circumstances connected with its history.

DESHA COUNTY

No remarks

DREW COUNTY

Geo. W. Sims, Assistant Marshall

The flux seems to have prevailed as an epidemic for the two last seasons, and there seems to be no local cause. The county where it prevailed is high and broken and has every appearance of health. The water, both spring and well, is free stone water. The soil light and sandy - no rock. Growth of the barren oaks on a portion of the country - there is pine in others - none. No fertilizer, no ores, as yet discovered. A large portion of the county is open flat prairies. The soil looks black and productive, but upon maul is formed strate and unfit for cultivation. Seasons - wet spring - hot and dry summers, and frost about the 15th of October as a general thing.

FRANKLIN COUNTY

No remarks

FULTON COUNTY

The diseases most prevalent in the county of Fulton are billiousintermitting fevers during the months of August and September succeeded by chills and fevers during the months of October, November and December and the early part of spring. We are occassionaly visited with pneumonia which is the only fatal disease that visits us in the shape of an epidemic and is generally to localities such as our largest waters, waters and rocks are mostly limestone also there has been very little ore discovered - some iron which is very abundant in many places. R. D. Bell, Assistant Marshall

GREEN COUNTY

This county is bounded on the east by the St. Francis River - on the west by Cache River. Through the entire length of the county runs Crowley Ridge which is formed of high and rigid hills spurs from which run into the fine rock bottom lands of St. Francis and Cache Rivers. The growth is red, and black and post oak, pine, hickory poplar, walnut, pine cypress, dogwood, and cherry. James W. Pool, Assistant Marshall

HEMPSTEAD COUNTY

E. L. Pryor, Assistant Marshall

There has been no particular malady prevalent in this district. The water is principally free stone, in some portions of the district, however, it is strongly impregnated with lime, while in other parts but little other than cistern water is used. The character of the soil is much valued embracing almost every variety from the richest black maul to the sandy soils. In some parts of the district lime exists in abundance, in other portions it is scarce, and in others none. There are

no known ores of any quality. In the major portion of the district, rock is exceedingly scarce, and where it does exist it is of a calcarious nature or partially decomposed limestone. The growth of timber is luxuriant, and consists of many varieties. The principal portion, however, is pine, oak, hickory, ash, gum, dogwood, walnut and wild cherry. Among the varieties is one, the growth of which is principally confined to the black maul soil, known as the Bois D'Arc or Osage Orange, which is much valued for its strength, elasticity, and durability. It is principally used in the manufacture of waggons, and possesses coloring properties similar to the Rustic of Commerce and is becoming much used in some parts of the United States for hedging.

HOT SPRING COUNTY

N. P. Woods, Ass't. Marshall

This county is considered healthy, tho in the river and creek bottoms chills and intermittent fevers prevail but very seldom prove fatal. Our county is well watered bounded on the E by the Saline River and on the W by the DeRoche and the Washita running through. Plenty of creeks and branches on which are good mill sites and in their vicinity thousands of oak and pine timber with an abundance of magnetic and other ores of iron. The county abounds in Chalybeate and Sulphur Springs and the Hot Springs are in our midst. They are celebrated from Vermont to Texas for the cure of all kinds of rheumatism and syphilitic complaints and if the Title was settled there would be great improvements made so that more people could be accommodated, which would be a general benefit.

INDEPENDENCE COUNTY

W. L. McGuire, Ass't. Marshall

Typhoid fever has existed as an epidemic in a mild form for the last three years, cause unknown. Water - free and lime stone. Soil - uplands limestone. Rocks - lime and sand stone. Ores - iron, lead, maganres abundant. Seasons - moderate, this county will undoubtedly be rich in minerals, the products of the uplands are wheat, corn, oats and cotton and corn. The health of this county will compare with any in the United States.

IZARD COUNTY

JACKSON COUNTY

No remarks

JEFFERSON COUNTY

William Hines, Ass't. Marshall

Town of Pine Bluff: We have generally a very productive soil, good water, an abundance of timber of various kinds, the growth of the river bottoms is cottonwood, box elder, hack-

berry, walnut, oak, hickory, and cypress in great abundance. That of the uplands is principally pine, oak and hickory. The soil of the uplands is gravelly basin on a clay foundation and produces far better than a mere spectator wood suppose.

Vaughn Township: Settlements are easily procured of the best quality and from the many advantages that this county possesses in point of soil, water, timber, navigation we may reasonably expect to rival, if not surpass, any other county in the state being near the White River on the north. The Arkansas River running through the center of the county and bounded south by the Saline River.

Richland Township: The disease of our county is principally chills and fever in the summer and fall seasons (of a like character generally) pneumonia, or winter fever in the winter and fall seasons, the latter disease seldom attacks persons who are temperate and prudent in their habits. The cholera has visited our county to a small extent but it was brought among us by emigrant and steam boats and always disappeared when the cause was removed. The Arkansas River rises through the entire length of our county giving it perhaps the largest quantity of bottom lands of any other county on the river.

JOHNSON COUNTY

L. Maclean, Ass't. Marshall

The past year has been considered unusually healthy with the exception of measles - there were a great many cases, and as will be seen several deaths occasioned by them. The water is soft - no lime nor ores known. Soil with the exception of river bottoms rather light. Any quantity of hard sand and rock throughout the county. Timber - pine in considerable quantity as also white, black and post oak. The rich river bottoms are subject to overflow and it is usually considered unhealthy living upon them. Since June first the deaths have been in proportion to those of last year - more than two to one - the season however is considered more than usually unhealthy.

LAFAYETTE COUNTY

No remarks

LAWRENCE COUNTY

Piney Fork Township: The water in this county is generally very good, limestone mostly - some soil on the river bottoms are exceedingly rich. Timber - oak, ash, walnut, hackberry. On the uplands the soil is light sandy and produces very well. The timber is black jack and every variety of oak, hickory and the rock limestone, sandstone, flint. And this county has the finest water power in the west.

Blackriver Township: There are several deposits of white carbonate of zinck and several large deposits of iron ore also. There are several deposits of lead tho it has not been found in large quantities. Black River runs south across the east end of the county and is navigable for the largest class of steam boats three fourths of the year and for several boats all the year. The mineral region is from 5 to 10 miles from the river.

MADISON COUNTY
Bowen Township:

W. Houser, Ass't. Marshall
Situating just above War Eagle or the War Eagle River, Bowen Twp. does not differ essentially from the former. For the sake of topographical precision however, it may be mapped by subdivision. 1st. the mountainous portions afford some arable land on the the tables and declivities, well adapted to the culture of the vine and fruit trees of large description. 2nd. The middle or uplands afford much good farming land in this township. The soil is not so heavy, yet it is productive and easily cultivated. 3rd. The bottom lands are deep rich and productive yielding in abundance wheat, corn, tobacco, hemp. 4th. The soil is made easily arable by a general diffusion of sand rocks. In this township are chiefly limestone. Limestone may be found, some pure, mostly however, cretous, magnesian, and micaceous. Timber - oak, hickory, cherry, walnut, elm, dogwood, Undergrowth - spicewood and hazle. The water chiefly freestone, limestone may be found. The greater portion however is impregnated with ferruginous cretous or sulphuretted matter. Diseases - principally miasmatic; the scarlet and millet fevers have prevailed in this township.

The Town of Huntsville: Huntsville is the county seat of Madison County - is agreeably situated on high, dry, sandy soil. The sight is not level, but undulating and pleasantly elevated. The buildings though not magnificent are nevertheless neat, frugal and appropriate. It has a court house and jail. The buildings are mostly painted white, the streets pleasantly adumbrated by ornamental shades, and the town abundantly supplied with the purest and best spring water. It has six stores, four smiths shops, two waggon shops and the whole scenery gives to the eye of the beholder the most lively impression of health, industry and property. Having no local cause of disease, a boyant atmosphere, and the purest best water, it is not surpassed by any village in the State for prospects of health. Rocks - sandstone is most abundant. Limestone, however, is found, pure cretous, magnesian and micaceous ferruginous sandstone fosentous and disintegrated silicious

pebble, abound greatly. Water - pure freestone may be found, most of the water however is ferruginous, cretous and magnesian, vary rarely pure limestone. The impregnation however is not so great as to render it either unpleasant or unwholesome. War Eagle the small river which passes through the township is a mill stream. Coal, chalk, allum, and iron ore are found in the township. Diseases - chiefly miasmatic.

War Eagle Township: In the description of this township three topographical subdivisions will embrace the whole. 1st. These mountainous portions are highly tabled upon stratified, embeded sandstone, which in many parts is richly overlaid with unctuous productive soil, and 2nd the table or second bottoms, called uplands, have a mellow, arable soil mostly lamous admixt with sand. 3rd. The bottom lands which lie chiefly on the War Eagle Creek present a deep rich alluvial soil, made mellow by the suffusion of sand. This class of lands is of a superior quality, highly productive of corn, wheat, hemp, tobacco and all articles suited to the climate. Timbers - oak, hickory, cherry, walnut, ash, maple, gum, chinkapin and dogwood. Undergrowth; spicewood and hazel. Rocks - sandstone is most abundant, limestone, however, is found, pure cretous, magnesian and micaceous, ferruginous sandstone, foetulous and disintegrated silicious pebble abound greatly. Water - pure freestone may be found, most of the water however is ferruginous, cretous and magnesian, very rarely pure limestone. The impregnation, however, is not so great as to render it either unpleasant or unwholesome. War Eagle, the small river which passes through the township, is a mill stream.

Kings River Township: The topography of this township may be better mapped by subdivision. 1st. The mountainous portions being irrodations of the Boston Mountains, often afford an entableture of rich productive soil, highly favorable to the growth of the grape vine and fruit trees of every description. 2nd. The uplands or second bottoms aford an excellent quality of mellow, arable productive soil. 3rd. The bottom lands lying on King River, which passes through the township, have a deep rich alluvial soil well adapted to the growth of corn, wheat, hemp, and tobacco. Timber - oak, hickory, ash, cherry, walnut, gum, dogwood, and maple. Chalk, magnesia, salt peter and sulphates of iron are found.

Prairie Township: In order to exhibit topographical precision, we may note several divisions. 1st. The mountainous portions are not so productive, being covered chiefly with fossicolous and silicious pebble. The grape vine and fruit tree flourish abundantly. 2nd. The prairie lands are the principal agricultural portions of the township.

Hilburn Township:

They abound in small prairies circumviraned with timbers constituting beautiful small farms, with every facility of water, timber and stock range. The soil is highly productive, easily arable and well adapted to the growth of wheat, corn, potatoes and the like. This township in order to make topographical distinction may be better mapped by subdivisions. 1st. The mountainous portions, being irrodations of the Boston Mountains, are deeply broken, precipitous and craggy. Upon the tabled area of the mountain top however, we occasionally find a section of excellent land, well adapted to the growth of the vine and fruit trees of every description. 2nd. The bottoms, or uplands, are of excellent quality yielding wheat, corn and affording every facility of water, timber and the like. 3rd. The bottom lands which lie on the White River afford a deep rich alluvial soil, yielding wheat, corn and the like. Many facilities for stock raising and farming on a moderate scale are available in this township. Diseases - miasmatic, scarlet fever has been observed.

Cedar Creek Township:

The mountainous portions which are highly elevated and extremely broken, covered often with craggy projections of stratified sandstone, disintegrated silicious pebble and occasionally limestone. The mountains in general are too much overspread with rock and pebble for agricultural purposes. They afford, however, an excellent stock range in the summer. 2nd. Bottoms or table land are rather sparse, many excellent farms are nevertheless found on the table lands. 3rd. The bottom lands in this township are of a superior quality. Springs are abundant, water of an excellent quality. Salt petre, alum chalk, and lead ore of an excellent quality.

Richland Township:

This township according to the import of its name, affords an abundance of rich land. For the sake of topograhphical distinction, our remarks may be more conveniently thrown into subdivisions. 1st. The mountainous portions afford much good tillable land, yielding abundantly wheat, corn, tobacco, etc. 2nd. The prairie land has a deep unctious soil equal to any land (river land excepted) in the state. The prairies are circumviraned with timbers, and are well adapted to agricultural pursuits. There is also in this township a fair proportion of heavy timbered land, which affords a deep rich lomous soil. The appellation of "Richland" to this township has not been misapplied, but is abundantly verified both in timbered and prairie lands. Timber - walnut, cherry, oak, hickory, ash, elm and the sugar maple.

MARION COUNTY

James M. Cowdrey, Ass't. Marshall

It is manifest from the foregoing report that no country is, or can be, more exempt from mortality. The report of disease contracted from causes dependent on the country, or climate we inhabit. The two first cases were from diseases contracted abroad. The two next that follow are usually a result of idiosyncrasy and are to be met with in the most healthy and salubrious regions on earth. The weak I am persuaded died of neglect. The last but confirms the impression I have for a long time entertained that our climate is as salubrious and our country as healthy as any in the world. *The murders have nothing to do with the health of this country - they grew out of a feud of long standing.

MISSISSIPPI COUNTY

The whole of Mississippi Co. is composed of light alluvial soil of which 49 out of every 50 acres are overflowed from the Mississippi River every year, leaving a large number of lakes covering from 100 to 5,000 acres which gradually drying causes the inhabitants to be more subject to chills and fevers than all other diseases put together. Wm. J. Jones, Ass't. Marshall

PHILLIPS COUNTY

Mooney Township:

Q. K. Underwood, Ass't. Marshall

The soil is Mississippi River bottom, the entire township is liable to overflow. The water used is principally from the Miss. River. The growth is principally cotton annual.

Laryville Township:

There are two causes which are calculated to make this township unhealthy; the first, at least two-thirds of the township is liable to almost annual overflow and the next the description of water used, it being generally from the St. Francis River which in character is very unpleasant.

Big Creek Township:

The greater part of Big Creek Township is what might be termed first rate upland and is generally high and dry. The water is generally from wells.

Town of Helena:

It will be seen that the scarlet fever prevailed to some extent in the town of Helena within the year ending June 1, 1850. The character of the soil is immediately in the town near the river, Miss. bottom but within half mile of the river rich clay hills set in. The timber in these hills is principally oak, ash, beach, etc. Water used is Miss. River, cistern and wells.

*For explanation of the assistant marshall's comment on murders, see page 25, William King, Jr. and William Y. King in Marion County Mortality Schedule.

PIKE COUNTY

W. H. Preston, Ass't. Marshall
 Limestone water. County broken and hilly. Well watered.
 Rock - limestone and white quartz
 Timber - yellow pine, oak, hickory, ash and walnut.
 Iron ore also abounds in the northern part of the county.

POINSETT COUNTY

No remarks

POLK COUNTY

Peter B. Allen, Ass't. Marshall
 Diseases in Polk County of any kind are almost wholly unknown, as the schedules of mortality will show people in the State of Arkansas good health. The water is principally freestone, though sulphur springs also are quite numerous, no less than six are frequented more or less during the summer - more though from the adjoining and other counties and states. The face of the county is mountainous, abounding with vallies which are greatly undulating and the streams afford excellent privileges for machinery of any description. The soil is gravelly loam, highly productive for grain of all kinds, and the rocks of the county are mostly primitive granite, though slate, soapstone and crystallized quartz are very common in most parts of the county, lead ore has been found in different places though none have been worked to any extent. The timber consists of oak, hickory, walnut ash, pine, cherry and dogwood.

POPE COUNTY

No remarks

PRAIRIE COUNTY

The northern part of Prairie County is undulating, some portions are covered with a thick growth of shrubs, others thinly set with oak and hickory trees, the surface being covered with grass affording rich pasturage. The water is freestone. The middle of the county contains a great quantity of prairie land, admirably adapted to the raising of cattle. The extreme southern portion is low and marshy, fertile and very heavily timbered and capable of affording immense quantities of hay if cultivated for that purpose.

J. W. Moore, Ass't. Marshall

MONROE COUNTY

John A. Harvick, Ass't. Marshall
 Winter fever, or pneumonia, is the most prevalent disease in this district, caused from the changeableness of the weather and dampness of the atmosphere, many cases of which occur in each year, but few cases of cholera have reached this section. Well water is

used entirely through this district which is mostly freestone Rockroe Township the water is strongly tintured with rotten limestone and in many cases cannot be used. No rock in any portion of the district. Soil - is rich in most of the district, some portions however is slack land and some poor. Prairie which will not produce well. No ores of any kind have been discovered in the district. Natural growth of timber consists of elder, oak, black oak, sweet and black gum, white and post oak, walnut, sassafras, cherry, swamp oak, mulberry and many other kinds too tedious to mention. Drouth of some ten weeks last summer - crops all short.

MONTGOMERY COUNTY

No remarks

NEWTON COUNTY

Pendleton Porter, Ass't. Marshall

My district embraces the head waters of the Buffalo Fork of White River and it is, no doubt, one of the most healthy portions of the state. The above statement is an over average of the annual deaths in this county. There is not a resident physician of any eminence in the county. Pure air, pure water and mountain life are our securities for health and happiness.

OUACHITA COUNTY

B. N. Ingram, Ass't. Marshall

The city of Camden is situated on the west bank of the Ouachita River at the head of steam boat navigation and is a place of considerable commercial importance and rapidly increasing as the county settles up, which it is doing very fast. The County of Ouachita is a well watered and healthy county off the river and large bayous, and is as productive as any upland county in the same latitude, producing cotton, corn, oats, sweet potatoes and peas remarkably well, and the county is settled by a population of remarkable for industry, sobriety, morality and hospitality.

PERRY COUNTY

No remarks

PHILLIPS COUNTY

Searcy Township:

A large portion of Searcy Township is liable to overflow unless protected by levees. The soil on the second bottom is of the best character. There is much cistern water now used, previous to which the township was very unhealthy as the natural water is very unwholesome.

St. Francis Township: As will be seen, a large majority of the deaths recorded are from cholera and scarlet fever, which diseases have prevailed in this township at intervals for two years. The soil is diversified - partly river bottom, partly second rate upland, and partly poor hilly land.

Walnut Township: Walnut Twp. lies between the Mississippi and St. Francis Rivers and much of it is low and liable to overflow. As will be seen the cholera killed a number of Negroes. It was thought that many of those who died could have been saved had good management prevailed.

PULASKI COUNTY

John P. Trigg, Ass't. Marshall

The uplands of this county are generally rocky, very healthy, but not productive compared with the river bottoms. The bottom, or alluvial land, is unsurpassed by any land in the southwest and produces corn and cotton in abundance. The timber in the bottoms is cottonwood, cypress, black walnut, cherry, hickory, elm and dogwood. The growth of the upland is the red, black and post oak principally, also hickory and dogwood. Very remarkable lead mines have been discovered in this county and partially worked for two years. The ore is originally found and yields from 40 to 120 ounces of silver per ton. It cannot be said that any regular lead has ever been struck, tho more than 200 tons of ore have been raised and shipped - that which has been raised is what miners term "bunch mineral". A main shaft is however now being sunk, which will in the course of another year test the value of these mines. The reported discoveries of gold in this state are all "humbug". Iron ore of a very fine quality, however, does exist in inexhaustible quantities. Coal is also plentiful.

RANDOLPH COUNTY

No remarks

ST. FRANCIS COUNTY

No remarks

SALINE COUNTY

W. K. English, Ass't. Marshall

The uplands of this county are generally very healthy; the river and creek bottoms are not so. The diseases engendered by colds in the winter and spring are more fatal than any other. The uplands are hilly; the soil good for farming purposes; the whole county is well watered; the growth of oak, hickory, ash, walnut, and dogwood abound, many of the hills are covered with fine pine. Soapstone, slate, quartz, limestone, sandstone and granite all abound.

SCOTT COUNTY

No remarks

SEARCY COUNTY

John Campbell, Ass't. Marshall

The county has been exempt from any epidemic since its settlement. The face of the country is undulating at some points - at others its hills are elevated high and rocky cliffs are common in which are a variety of caverns where niter is found plentifully. Millstone and whetstone grit exist in abundance. The soil is alluvial and highly productive. There is many white sulphur and calebeate springs. The water is generally limestone. Iron ore is found at many locations abundant. Timber - all the varieties of oaks, black walnut, cherry, ash elm, and mulberry grow promiscuously throughout the county.

SEVIER COUNTY
